

Auditable workload-to-grid verification and settlement

Information boundaries are explicit: execution telemetry is a scoring truth, not an estimator input.

OBSERVED DATA

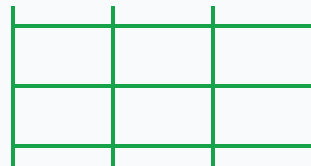

Workload ledger

arrivals, classes, deadlines
spatial identity and energy

immutable IDs

BurstGPT + MIT scheduler/DCGM

STATE MODEL

release • conservation • deadline • capacity

ledger → load

VERIFICATION

Feasible counterfactual

sparse cumulative flow LP
validation-only risk selector
pointwise credit envelope

verified state

GRID VALUE

signed nodal value + complete N-1

prices + contingencies

SCORING

Measured execution

15-min facility trace
held out from estimation

CONTRACT LAYER

Telemetry-calibrated payment certificate

finite q10/q50/q90 samplewise guarantee • q01/q99 endpoint worst-case interval audit
bilateral net-value transfer • exact Shapley allocation • numerical residual audit

observational replay only; no causal event label
